Chapter 1 Getting Started

Introduction

The EM2037 series embedded 2D barcode scan engines are armed with CMOS image capturer and the Newland patented **UIMG®**, a computerized image recognition system, featuring fast scanning and accurate decoding on barcodes on virtually any medium - paper, magnetic card, mobile phones and LCD displays. The EM2037s can be easily integrated into OEM equipments or systems, such as hand-held, portable, or stationary barcode scanners.

Moreover, the EM2037s open image acquisition interface, data interface and I/O interface to OEM developers to allow their special integration needs. EM2037 Software Development Kit is provided for easy and quick development of OEM applications.

About This Guide

This guide provides programming instructions for the EM2037. Users can configure the EM2037 by scanning the programming barcodes included in this manual.

The EM2037 has been properly configured for most applications and can be put into use without further configuration. Users may check the Factory Defaults Table in Appendix for reference. Throughout the manual, programming barcodes marked with asterisks (**) are factory default values.

Document Set

EM2037 related documents include:

NLS-EM2037 Series Embedded 2D Barcode Scan Engine Integration Manual:	Describes how to integrate the EM2037.
NLS-EM2037 Series Embedded 2D Barcode Scan Engine User Guide:	Describes how to use and program the EM2037.
Sample Barcodes:	Provides sample barcodes for testing the EM2037.

Connecting EVK to PC

The supplied EM2037 EVK tool can assist users in application development for the EM2037. You can connect EM2037 EVK to PC via a USB connection or an RS-232 connection. In case of USB connection, a driver is required and EVK can communicate with EM2037 and receive decoded data through virtual serial port.

Barcode Scanning

Powered by area-imaging technology and Newland patented **UIMG°** technology, the EM2037 feasures fast scanning and decoding accuracy. Barcodes rotated at any angle can still be read with ease. When scanning a barcode, simply center the aiming beam or pattern projected by the EM2037 over the barcode.

Programming Barcodes

Scanning the **Enter Setup** barcode can enable the engine to enter the setup mode. Then you can scan a number of programming barcodes to configure your engine. To exit the setup mode, scan the **Exit Setup** barcode.

If the engine has exit the setup mode, only some special programming barcodes, such as the **Enter Setup** barcode and **Restore All Factory Defaults** barcode, can be read.

0006010
Enter Setup

0006000
** Exit Setup

Programming barcode data can be transmitted to the Host. Scan the appropriate barcode below to enable or disable the transmission of programming barcode data (programming commands) to the Host.

0002010
Transmit Programming Barcode Data

0002000
** Do Not Transmit Programming Barcode Data

Factory Defaults

Scanning the following barcode can restore the engine to the factory defaults. See **Appendix 1: Factory Defaults Table** for more information.

Restoring the engine to factory defaults will not remove custom defaults stored on the engine.

```
0001000
```
Restore All Factory Defaults

Note: Use this feature with discretion.

Custom Defaults

Scanning the **Restore All Custom Defaults** barcode can reset all parameters to the custom defaults. Scanning the **Save as Custom Defaults** can set the current settings as custom defaults.

Custom defaults are stored in the non-volatile memory.

```
0001150
```
Save as Custom Defaults

```
0001160
```
Restore All Custom Defaults

Product Information

Obtain Product Information: Transmit the product information to the Host straight away via the communication interface.

||| ||||| |||| ||| ||| |||
0003000

Obtain Product Information

Send Product Information at Startup: Transmit the product information to the Host when the engine is powered on. This feature only applies to engines using a serial communication interface.

||| ||| ||||| ||| |||
0007010

Send Product Information at Startup

||| ||||| ||| ||| |||
0007000

Do Not Send Product Information at Startup

Chapter 2 Communication Interfaces

Introduction

The EM2037 engine provides a TTL-232 interface and a USB interface to communicate with the host device. The host device can receive scanned data and send commands to control the engine or to access/alter the configuration information of the engine via the TTL-232 or USB interface.

Serial Communication Interface

Serial communication interface is usually used when connecting the engine to a host device (like PC, POS). However, to ensure smooth communication and accuracy of data, you need to set communication parameters (including baud rate, parity check, data bit and stop bit) to match the host device.

The serial communication interface provided by the engine is based on TTL signals. TTL-232 can be used for most application architectures. For those requiring RS-232, an external conversion circuit is needed. The conversion circuit is available only to some models.

```
1100000
```
Serial Communication

Default serial communication parameters are listed below. Make sure all parameters match the host requirements.

Parameter	Factury Default
Serial Communication	Standard TTL-232
Baud Rate	9600
Parity Check	None
Data Bits	8
Stop Bits	1
Hardware Auto Flow Control	None

Baud Rate

Baud rate is the number of bits of data transmitted per second. Set the baud rate to match the Host requirements.

0100030
** Baud Rate 9600
0100050
Baud Rate 19200

0100000
Baud Rate 1200

0100060
Baud Rate 38400

0100010
Baud Rate 2400

0100070
Baud Rate 57600

0100020
Baud Rate 4800

0100080
Baud Rate 115200

0100040
Baud Rate 14400
Parity Check
0101000
** None

0101010
Even Parity

0101020
Odd Parity

Data Bit

0103030
** 8 Data Bits

0103010
6 Data Bits

0103020
7 Data Bits

0103000
5 Data Bits
Stop Bit

0102000
** 1 Stop Bit

0102010
2 Stop Bits

Hardware Flow Control

If this feature is enabled, the engine determines whether to transmit data based on CTS signal level. When CTS signal is at a low level which means the serial port's cache memory of receiving device (such as PC) is full, the engine will not send data through RS-232 port until CTS signal is set to high level by receiving device. When the engine is not ready for receiving, it will set RTS signal to low level. When sending device (such as PC) detects it, it will not send data to the engine any more to prevent data loss.

If this feature is disabled, reception/transmission of serial data will not be influenced by RTS/CTS signal.

0104010
Enable Hardware Flow Control

0104000
** Disable Hardware Flow Control

Note: Before enabling this feature, make sure that RTS/CTS signal line is contained in RS-232 cable. Without the signal line, serial communication errors will occur.

USB Interface

USB-DataPipe

A driver is required when using this protocol to communicate with the engine. Its advantages include fast data transmissoin and easy to use.

1100010
USB-Datapipe

USB HID-KBW

When you connect the engine to the Host via a USB connection, you can enable the USB HID-KBW feature by scanning the barcode below. Then engine's transmission will be simulated as USB keyboard input. The Host receives keystrokes on the virtual keyboard. It works on a Plug and Play basis and no driver is required.

1100020
USB HID-KBW

0006000
**Exit Setup

USB Country Keyboard Types

Keyboard layouts and country codes vary from country to country. All supported keyboard types are listed in the Country Code Table. The default setting is US keyboard type.

To learn how to select a keyboard type, see the example below.

1103000
Select Country Code

Country Code Table (Appendix 5)

Country/Language	Code	Country/Language	Code
US	0	Netherlands(Dutch)	14
Belgium	1	Norway	15
Brazil	2	Poland	16
Canada(French)	3	Portugal	17
Czechoslovakia	4	Romania	18
Denmark	5	Russia	19
Finland(Swedish)	6	Slovakia	21
France	7	Spain	22
Germany/Austria	8	Sweden	23
Greece	9	Switzerland(German)	24
Hungary	10	Turkey F	25
Israel(Hebrew)	11	Turkey Q	26
Italy	12	UK	27
Latin-American	13	Japan	28

Example: Program the engine to emulate Norwegian keyboard (Norway)

1. Scan the **Enter Setup** barcode.

2. Scan the **Select Country Code** barcode.

3. Check the country code for Norway in the Country Code Table. (Norway: 15)

4. Scan the numeric barcodes "1" and "5".

5. Scan the **Save** barcode.

6. Scan the **Exit Setup** barcode.

Beep on Unknown Character

Due to the differences in keyboard layouts, some characters contained in barcode data may be unavailable on the selected keyboard. As a result, the engine fails to transmit the unknown characters.

Scan the appropriate barcode below to enable or disable the emission of beep when an unknown character is detected.

1103031

Beep on Unknown Character

1103030

** Do Not Beep on Unknown Character

Emulate ALT+Keypad

When Emulate ALT+Keypad is turned on, any ASCII character (0x00 - 0xff) is sent over the numeric keypad no matter which keyboard type is selected. Since sending a character involves multiple keystroke emulations, this method appears less efficient.

1103061

Emulate ALT+Keypad ON

1103060

** Emulate ALT+Keypad OFF

Function Key Mapping

When Function Key Mapping is enabled, function character (0x00 - 0x1F) are sent as ASCII sequences over the numeric keypad. For more information, see **Appendix 6: ASCII Function Key Mapping Table**.

A shortcut to send a function key (F1-F12) is to scan the corresponding barcode in **Appendix 9: F-Key Barcodes**.

Note: Emulate ALT+Keypad ON prevails over **Enable Function Key Mapping**.

1103140
Enable Function Key Mapping

1103130
** Disable Function Key Mapping

Example: Barcode data 0x16

	Enable Function Key Mapping	Ctrl +V
T	Disable Function Key Mapping	F1

Inter-Keystroke Delay

This parameter specifies the delay between emulated keystrokes.

1103050
** **No Delay**

1103051
Short Delay (20ms)

1103052
Long Delay (40ms)

Caps Lock

The **Caps Lock ON** option can invert upper and lower case characters contained in barcode data. This inversion occurs regardless of the state of Caps Lock key on the Host's keyboard.

1103020
Caps Lock ON

1103010
** **Caps Lock OFF**

Note: Emulate ALT+Keypad ON/ Convert All to Upper Case/ Convert All to Lower Case prevails over **Caps Lock ON**.

Example: When the **Caps Lock ON** is selected, barcode data "AbC" is transmitted as "aBc".

Convert Case

Scan the appropriate barcode below to convert all bar code data to your desired case.

‖‖‖‖‖‖‖‖‖
1103040
** No Case Conversion

‖‖‖‖‖‖‖‖‖
1103041
Convert All to Upper Case

‖‖‖‖‖‖‖‖‖
1103042
Convert All to Lower Case

Example: When the **Convert All to Lower Case** feature is enabled, barcode data "AbC" is transmitted as "abc".

Emulate Numeric Keypad

When this feature is disabled, sending barcode data is emulated as keystroke(s) on main keyboard.

To enable this feature, scan the **Emulate Numeric Keypad** barcode. Sending a number (0-9) is emulated as keystroke(s) on numeric keypad, whereas sending other character like "+", "_", "*" , "/" and "." is still emulated as keystrokes on main keyboard.

Numeric keypad is usually situated at the right of the main keyboard. The state of Num Lock on the simulated numeric keypad is determined by its equivalent on the Host. If Num Lock on the Host is turned off, the output of simulated numeric keypad is function key instead of number.

Emulate Numeric Keypad

** Do Not Emulate Numeric Keypad

 Note: Make sure the Num Lock light of the Host is turned ON before enabling this feature.

Simulate ALT+Keypad ON prevails over **Emulate Numeric Keypad**.

Example: Supposing the **Emulate Numeric Keypad** feature is enabled:

if Num Lock on the Host is ON, "A4.5" is transmitted as "A4.5";

if Num Lock on the Host is OFF, "A4.5" is transmitted as follows:

1. "A" is sent as is because it is not included in numeric keypad;

2. "4" is sent as the function key "Cursor Move to Left";

3. "." is sent as the function key "Delete After the Cursor";

4. "5" is not sent as it does not correspond to any function key.

USB COM Port Emulation

If you connect the engine to the Host via a USB connection, the USB COM Port Emulation feature allows the Host to receive data in the way as a serial port does. However, you need to set communication parameters on the engine to match the Host requirements.

1100060
USB COM Port Emulation

HID-POS

The HID-POS interface is recommended for new application programs. It can send up to 56 characters in a single USB report and appears more efficient than keyboard emulation.

Features:

 ✧   HID based, no custom driver required.

 ✧   Way more efficient in communication than keyboard emulation and traditional RS-232 interface.

Note: HID-POS does not require a custom driver. However, a HID interface on Windows 98 does. All HID interfaces employ standard driver provided by the operating system. Use defaults when installing the driver.

1100080
HID-POS

Access the engine with your program:

1.   Use CreateFile to access the engine as a HID device.

2.   Use ReadFile to deliver the scanned data to the application program.

3.   Use WriteFile to send data to the engine.

For detailed information about USB and HID interfaces, go to www.USB.org.

Acquire Scanned Data

After a barcode is decoded, the engine sends an input report as below:

Byte	Bit							
	7	6	5	4	3	2	1	0
0	Report ID = 0x02							
1	Barcode Length							
2-57	Decoded Data (1-56)							
58-61	Reserved (1-4)							
62	Symbology ID Number (Appendix 7) or N/C: 0x00							
63	-	-	-	-	-	-	-	Decode Data Continued

VID/PID

USB uses VID (Vendor ID) and PID (Product ID) to identify and locate a device. The VID is assigned by USB Implementers Forum. Newland's vendor ID is 1EAB (Hex). A range of PIDs are used for each Newland product family. Every PID contains a base number and interface type (keyboard, COM port, etc.).

Product	Interface	PID (Hex)	PID (Dec)
EM2037	Base	0000	0
	HID-POS	0010	16

IBM SurePOS(Tabletop)
1100090

IBM-SurePOS (Table-Top)

IBM SurePOS (Handheld)

1100100

IBM-SurePOS (Hand-Held)

Chapter 3 Scan Mode

Trigger Mode

If the Trigger Mode is enabled, receiving a valid trigger signal activates a decode session. The session continues until the barcode is decoded as long as the trigger signal remains valid; the session stops when the signal becomes invalid. For good decode, the engine transmits decoded data via communication port. To activate another session, the Host first terminates the trigger signal, waits 20ms or longer and then makes the signal valid.

||||| ||| ||| ||||| |||
0302000
Trigger Mode

Auto Mode

If the Auto Mode is enabled, the engine activates a decode session every time it detects a change in ambient illumination. The decode session continues until the barcode is decoded or the Decode Session Timeout occurs.

Receiving a trigger signal can also activate a decode session. The decode session continues until the trigger signal becomes invalid or the barcode is decoded or the Decode Session Timeout occurs. The trigger signal needs to be terminated before the engine is able to monitor ambient illumination again.

||||| ||| ||| ||||| |||
0302010
** Auto Mode

Decode Session Timeout

This parameter sets the maximum time decode session continues during a scan attempt in the Auto Mode. It is programmable in 1ms increments from 500ms to 3600000ms. The default timeout is 3000ms. To learn how to program this parameter, see the **"a. Program the Decode Session Timeout"** section in Appendix.

0313000
Decode Session Timeout

Timeout Between Decodes (Same Barcode)

In order not to decode a barcode repeatedly, you can program this parameter to prevent the engine from rereading the same barcode in a given period of time.

This parameter sets the timeout between decodes for the same barcode in the Auto Mode. It is programmable in 1ms increments from 1ms to 3600000ms. The default timeout is 1500ms.

To learn how to program this parameter, see the **"b. Program the Timeout between Decodes (Same Barcode)"** section in Appendix.

0313010
Timeout Between Decodes (Same Barcode)

Disable Timeout Between Decodes: Allow the engine to re-read the same barcode.

Enable Timeout Between Decodes: Do not allow the engine to re-read the same barcode before the Timeout Between Decodes (Same Barcode) occurs.

0313020
** Disable Timeout Between Decodes

0313030
Enable Timeout Between Decodes

Continuous Mode

This mode enables the engine to scan/capture, decode and transmit over and over again.

If the Continuous Mode is enabled, the engine activates/suspends/resumes barcode reading through control over the trigger signal. When barcode reading is in progress, terminating the trigger signal after having kept it valid for 30ms or longer will suspend barcode reading; when barcode reading is suspended, performing the same control over the trigger signal will resume barcode reading.

0302020
Continuous Mode

Timeout Between Decodes (Same Barcode)

In order not to decode a barcode repeatedly, you can program this parameter to prevent the engine from rereading the same barcode in a given period of time.

This parameter sets the timeout between decodes for the same barcode in the Continuous Mode. It is programmable in 1ms increments from 1ms to 3600000ms. The default timeout is 1500ms.

To learn how to program this parameter, see the **"b. Program the Timeout between Decodes (Same Barcode)"** section in Appendix.

0313010
Timeout Between Decodes (Same Barcode)

Disable Timeout Between Decodes: Allow the engine to re-read the same barcode.

Enable Timeout Between Decodes: Do not allow the engine to re-read the same barcode before the Timeout Between Decodes (Same Barcode) occurs.

0313020
** Disable Timeout Between Decodes

0313030
Enable Timeout Between Decodes

Chapter 4 Scanning Preferences

Introduction

This chapter contains information as to how to adapt your engine to various applications with preference setting. For instance, to improve barcode reading performance off mobile phones and LCD displays; or to narrow the field of view of the engine to make sure it reads only those barcodes intended by the user.

Regular Mode/Mobile Phone Mode

The engine can capture barcodes printed on paper labels or displayed on the screen of a mobile phone. Select a mode as per actual need.

Regular Mode: Read barcodes printed on paper or plastic.

Mobile Phone Mode: Read barcodes off mobile phones or LCD displays.

||||||| ||||| |||
0321000
** Regular Mode

||||||| ||||| |||
0321020
Mobile Phone Mode

Decode Area

Whole Area Decoding

When this option is enabled, the engine attempts to decode barcode(s) within its field of view, from the center to the periphery, and transmits the barcode that has been first decoded.

||||||| ||||| |||
0322000
** Whole Area Decoding

Central Area Decoding

The engine attempts to decode barcode(s) within a specified central area and transmits the barcode that has been first decoded. This option allows the engine to narrow its field of view to make sure it reads only those barcodes intended by the user. For instance, if multiple barcodes are placed closely together, central area decoding in conjunction with appropriate pre-defined central area will insure that only the desired barcode is read.

0322010
Central Area Decoding

Specify Central Area

The default central area is a (Width*20%) by (Height*20%) area in the center of the engine's field of view, as shown in the figure below. You can define the central area by scanning the **Specify Central Area** barcode and numeric barcode(s) corresponding to a desired percentage (1-100). If Central Area Decoding is enabled by scanning the **Central Area Decoding** barcode, the engine only reads barcodes that intersect the predefined central area.
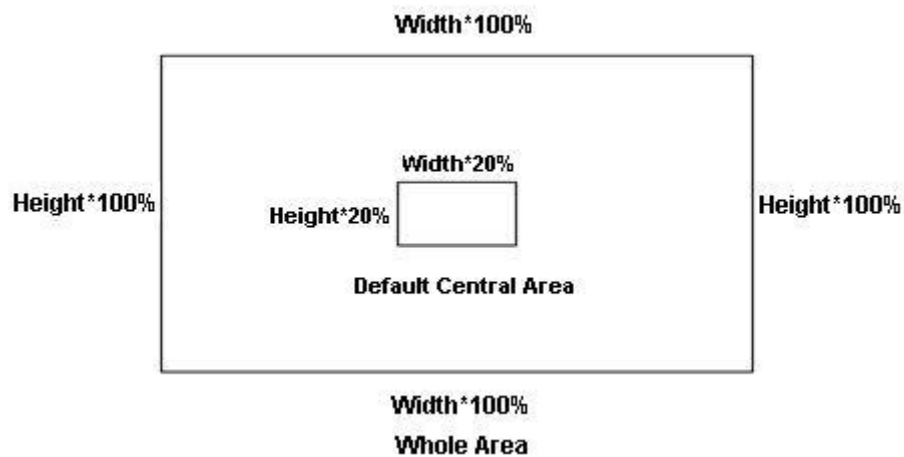

To learn how to program this parameter, see the **"c. Program the Central Area"** section in Appendix.

0322020
Specify Central Area

Chapter 5 Illumination & Aiming

Illumination

A couple of illumination options are provided to improve the lighting conditions during every image capture:

Normal: Illumination LEDs are turned on during image capture.

Always ON: Illumination LEDs keep ON after the engine is powered on.

OFF: Illumination LEDs are OFF all the time.

```
0200000
```
** Normal

```
0200010
```
Always ON

```
0200020
```
OFF

Aiming

When scanning/capturing image, the engine projects an aiming pattern which allows positioning the target barcode within its field of view and thus makes decoding easier.

Normal: The engine projects an aiming pattern only during barcode scanning/capture.

Always ON: Aiming pattern is constantly ON after the engine is powered on.

OFF: Aiming pattern is OFF all the time.

Chapter 6 Beep & LED Indications

Introduction

Besides communication output, the engine can also generate a PWM signal and a pulse signal. Those outputs in conjunction with external circuits are able to drive the beeper/LED indicator.

This chapter describes how to program the beep/LED notification feature.

Startup Beep

If startup beep is enabled, the engine will beep after being turned on.

0204001

** Enable Startup Beep

0204000

Disable Startup Beep

Beep after Good Decode

The engine can be configured to beep after good decode. Beep type (frequency) and volume (duty circle of PWM) are also user programmable.

0203010

0206023

Prolonged (320ms)

To learn how to program this parameter, see the "f. Program the LED Notification Duration for Good Decode" section in Appendix.

0206024

Custom (1 - 10000ms)

Chapter 7 Data Formatting

Introduction

In many applications, barcode data needs to be edited and distinguished from one another.

Usually AIM ID and Code ID can be used as identifiers, but in some special cases customized prefix and terminating character suffix like Carriage Return or Line Feed can also be the alternatives.

Data editing refers to appending prefix/suffix, data packing, etc.

Data formatting may include:

❖ Append AIM ID/Code ID/custom prefix before the decoded data

❖ Append custom suffix after the decoded data

❖ Pack data

❖ Append terminating character to the end of the data

General Settings

Enable/Disable All Prefix/Suffix

Disable All Prefix/Suffix: Transmit barcode data with no prefix/suffix.

Enable All Prefix/Suffix: Allow user to append Code ID prefix, AIM ID prefix, custom prefix/suffix and terminating character to the barcode data before the transmission.

0311010
Enable All Prefix/Suffix

0311000
** Disable All Prefix/Suffix

Prefix Sequences

0317010
**Code ID+Custom Prefix+AIM ID

0317040
Custom Prefix+Code ID+AIM ID

AIM ID Prefix

AIM (Automatic Identification Manufacturers) IDs and ISO/IEC 15424 standards define symbology identifiers and data carrier identifiers. (For the details, see the **"Appendix 2: AIM ID Table"** section). If AIM ID prefix is enabled, the engine will add the symbology identifier before the scanned data after decoding.

0308030
Enable AIM ID Prefix

0308000
** Disable AIM ID Prefix

Code ID Prefix

Code ID can also be used to identify barcode type. Unlike AIM ID, Code ID is user programmable. Code ID can only consist of one or two English letters.

0307010
Enable Code ID Prefix

0307000
** Disable Code ID Prefix

Restore All Default Code IDs

For the information of default Code IDs, see the **"Appendix 3: Code ID Table"** section.

0307020
Restore All Default Code IDs

Modify Code ID

Code ID of each symbology can be programmed separately. See the following example to learn how to program a Code ID.

Example: Set the Code ID of PDF417 to "p"

1. Check the hex value of "p" in the **Appendix 4: ASCII Table**. ("p": 70)

2. Scan the **Enter Setup** barcode.

3. Scan the **Modify PDF417 Code ID** barcode.

4. Scan the numeric barcodes "7" and "0".

5. Scan the **Save** barcode.

6. Scan the **Exit Setup** barcode.

Custom Prefix

Enable/Disable Custom Prefix

If custom prefix is enabled, you are allowed to append to the data a user-defined prefix that cannot exceed 10 characters.

0305010
Enable Custom Prefix

0305000
** Disable Custom Prefix

Set Custom Prefix

To set a custom prefix, scan the **Set Custom Prefix** barcode and then the numeric barcodes corresponding to the hexadecimal value of a desired prefix. To save the settings, scan the **Save** barcode.

Note: A custom prefix cannot exceed 10 characters.

0300000
Set Custom Prefix

Example: Set the custom prefix to "CODE"

1.   Check the hex values of "CODE" in the ASCII Table. ("CODE": 43, 4F, 44, 45)

2.   Scan the **Enter Setup** barcode.

3.   Scan the **Set Custom Prefix** barcode.

4.   Scan the numeric barcodes "4", "3", "4", "F", "4", "4", "4" and "5".

5.   Scan the **Save** barcode.

6.   Scan the **Exit Setup** barcode.

Custom Suffix

Enable/Disable Custom Suffix

If custom suffix is enabled, you are allowed to append to the data a user-defined suffix that cannot exceed 10 characters.

0306010

Enable Custom Suffix

0306000

** Disable Custom Suffix

Set Custom Suffix

To set a custom suffix, scan the **Set Custom Suffix** barcode and then the numeric barcodes corresponding to the hexadecimal value of a desired suffix. To save the settings, scan the **Save** barcode.

Note: A custom suffix cannot exceed 10 characters.

0301000

Set Custom Suffix

Example: Set the custom suffix to "CODE"

1. Check the hex values of "CODE" in the ASCII Table. ("CODE": 43, 4F, 44, 45)

2. Scan the **Enter Setup** barcode.

3. Scan the **Set Custom Suffix** barcode.

4. Scan the numeric barcodes "4", "3", "4", "F", "4", "4", "4" and "5".

5. Scan the **Save** barcode.

6. Scan the **Exit Setup** barcode.

Data Packing

For some applications that require high data integrity and reliability, data packing can help you accomplish that.

Transmission of packed data needs to work with certain software on the Host.

Data packing influences data format and is not recommended for general applications.

||||| |||| ||||| |||
0314000
** Disable Data Packing**

Normal Pack

Normal Pack format: [STX + ATTR + LEN] + [AL_TYPE + DATA] + [LRC]

✧ STX: 0x02

✧ ATTR: 0x00

✧ LEN: Barcode data length is expressed in 2 bytes, ranging from 0 to 65535.

✧ AL_TYPE: 0x36

✧ DATA: Raw barcode data.

✧ LRC: Check digit.

LRC calculation algorithm: computation sequence: 0xFF+LEN+AL_TYPE+DATA; computation method is XOR, byte by byte.

||||| |||| ||||| |||
0314010
Normal Pack

Terminating Character Suffix

A terminating character can be used to mark the end of data, which means nothing can be added after it.

A terminating character suffix can contain one or two characters.

Enable/Disable Terminating Character Suffix

To enable/disable terminating character suffix, scan the appropriate barcode below.

0309010
Enable Terminating Character Suffix

0309000
** Disable Terminating Character Suffix

Set Terminating Character Suffix

The engine provides a shortcut for setting the terminating character suffix to 0x0D or 0x0D,0x0A by scanning the following barcode.

0310010
Terminating Character 0x0D

0310020
Terminating Character 0x0D,0x0A

To set a terminating character suffix, scan the **Set Terminating Character Suffix** barcode and then the numeric barcodes corresponding to the hexadecimal value of a desired terminating character. To save the settings, scan the **Save** barcode.

Note: A terminating character suffix cannot exceed 2 characters.

0310000
Set Terminating Character Suffix

Example: Set the terminating character suffix to 0x0D

1. Scan the **Enter Setup** barcode.

2. Scan the **Set Terminating Character Suffix** barcode.

3. Scan the numeric barcodes "0" and "D".

4. Scan the **Save** barcode.

5. Scan the **Exit Setup** barcode.

Chapter 8 Symbologies

0405020

** Enable Interleaved 2 of 5

0405010

Disable Interleaved 2 of 5

Set Length Range for Interleaved 2 of 5

The engine can be configured to only decode Interleaved 2 of 5 barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

For more information, see the **"j. Program the Length Range (Maximum/Mininum Lengths) for a Symbology"** section in Appendix.

0405030

Set the Minimum Length (Default: 6)

0405040

Set the Maximum Length (Default: 80)

Parity Check

A check digit is optional for Interleaved 2 o 5 and can be added as the last digit. It is a calculated value used to verify the accuracy of the data.

No Parity Check: The engine transmits Interleaved 2 of 5 barcodes as is.

Do Not Transmit Check Digit After Parity Check: The engine will run a parity check using the last digit of Interleaved 2 of 5 barcode as check digit. Barcodes passing the check will be transmitted except the last digit, whereas those failing it will not be transmitted.

Transmit Check Digit After Parity Check: The engine will run a parity check using the last digit of Interleaved 2 of 5 barcode as check digit. Barcodes passing the check will be transmitted, whereas those failing it will not be transmitted.

0405050
** No Parity Check

0405060
Do Not Transmit Check Digit After Parity Check

0405070
Transmit Check Digit After Parity Check

Note: If the **Do Not Transmit Check Digit After Parity Check** option is enabled, Interleaved 2 of 5 barcodes with a length that is less than the configured minimum length after having the check digit excluded will not be decoded. (For example, when the **Do Not Transmit Check Digit After Parity Check** option is enabled and the minimum length is set to 4, Interleaved 2 of 5 barcodes with a total length of 4 characters including the check digit cannot be read.)

Set Discrete Lengths for Interleaved 2 of 5

The engine can be configured to only decode Interleaved 2 of 5 barcodes within a specific length range or with a couple of discrete lengths.

The length must be an even number not greater than 64 and consist of three digits (a leading zero or zeros may need to be added to meet the length requirement). For more information, see the **"k. Program the Discrete Lengths for Interleaved 2 of 5"** section in Appendix.

0405150
Enable the Discrete Lengths

0405140

** Disable Plessey

Set Length Range for Plessey

The engine can be configured to only decode Plessey barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

For more information, see the **"j. Program the Length Range (Maximum/Mininum Lengths) for a Symbology"** section in Appendix.

0419030
Set the Minimum Length (Default: 4)

0419040
Set the Maximum Length (Default: 48)

Parity Check

Check digits are optional for Plessey and can be added as the last two digits, which are calculated values used to verify the accuracy of the data.

No Parity Check: The engine transmits Plessey barcodes as is.

Do Not Transmit Check Digit After Parity Check: The engine will run parity checks using the last two digits of Plessey barcode as check digits. Barcodes passing the checks will be transmitted except the last two digits, whereas those failing them will not be transmitted.

Transmit Check Digit After Parity Check: The engine will run parity checks using the last two digits of Plessey barcode as check digits. Barcodes passing the checks will be transmitted, whereas those failing them will not be transmitted.

PDF417 Twin Code

PDF417 twin code is 2 PDF417 barcodes paralleled vertically or horizontally. Two of them must have the same direction and similar specifications and be placed closely together.

There are 3 options for reading PDF417 twin codes:

Single PDF417 Only: Read either PDF417 code.

Twin PDF417 Only: Read both PDF417 codes. Transmission sequence: left (upper) PDF417 code followed by right (lower) PDF417 code.

Both Single & Twin: Read both PDF417 codes. If successful, transmit as twin PDF417 only. Otherwise, try single PDF417 only.

Chapter 9 Troubleshooting

FAQ

Q: How to show barcode data in a text file (output data in a cursor)?

A: Enable the USB HID-KBW feature. But only characters and digits available on the keyboard can be sent.

Q: What are compatible/supported barcode types?

A: See the User Guide.

Q: How to change the format from ISBN-13 into ISBN-10?

A: Disable EAN-13 and then enable ISBN and ISBN-10.

Q: Some barcodes can't be read.

a) Find out the barcode type and check if the barcode type is enabled. See Appendix 1: Factory Defaults Table for default barcode types.
b) If the barcode type is enabled, check whether the parity check and length range settings match the barcodes.
c) If the barcodes are stained, defaced, torn, distorted or poorly printed, try barcodes of good print quality. If you need to scan barcodes off mobile phones, enable the Mobile Phone Mode.
d) Provide such information as model number, firmware version and barcode type when contacting our technical support.

Q: Some barcodes are decoded incorrectly.

a) Check whether the parity check and length range settings match the barcodes..
b) Provide such information as model number, firmware version and barcode type when contacting our technical support.

Q: Barcodes can be read, but cannot be displayed.

A: If barcodes contain non-alphanumeric character(s), change the communication mode (USB COM Port Emulation recommended).

Q: The device is frozen or unresponsive.

a) Check if the device is properly connected and powered up.

b) Send the Restore All Factory Defaults command to the device via a serial cable or USB cable.

Q: How to enable/disable terminating character (Carriage Return or Line Feed)?

A: See the User Guide.

Q: The device fails to communicate with QuickSet or UExpress.

A: Enable the USB Datapipe or USB COM Port Emulation feature.

Appendix

Appendix 1: Factory Defaults Table

Parameter	Factory Default	Remark
System Settings		
Barcode Programming	Disabled	
Programming barcode data	Do not send	
Illumination	Normal

Codabar	015	Chinese Sensible Code	039
Code 93	017		
ISBN	024		
Industrial 2 of 5	025		

Appendix 8: Parameter Programming Examples

The following examples show you how to program parameters by scanning programming barcodes.

a. Program the Decode Session Timeout

Example: Set the decode session timeout to 1500ms
1. Scan the **Enter Setup** barcode.
2. Scan the **Decode Session Timeout** barcode. (See the **"Decode Session Timeout"** section in Chapter 3)
3. Scan the numeric barcodes "1", "5", "0" and "0".
4. Scan the **Save** barcode.
5. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

b. Program the Timeout between Decodes (Same Barcode)

Example: Set the timeout between decodes (same barcode) to 1000ms
1. Scan the **Enter Setup** barcode.
2. Scan the **Timeout between Decodes (Same Barcode)** barcode. (See the **"Timeout between Decodes (Same Barcode)"** section in Chapter 3)
3. Scan the numeric barcodes "1", "0", "0" and "0".
4. Scan the **Save** barcode.
5. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

c. Program the Central Area

Example: Set the percentage of central area to 20%
1. Scan the **Enter Setup** barcode.
2. Scan the **Specify Central Area** barcode. (See the **"Specify Central Area"** section in Chapter 4)
3. Scan the numeric barcodes "2" and "0".
4. Scan the **Save** barcode.
5. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

d. Program the Duration of Good Decode Beep (Type 1)

Example: Set the duration of good decode beep to 100ms

1.   Scan the **Enter Setup** barcode.
2.   Scan the **Custom** barcode. (See the **"Beep Duration"** section in Chapter 6)
3.   Scan the numeric barcodes "1" , "0" and "0".
4.   Scan the **Save** barcode.
5.   Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

e. Program the Frequency of Good Decode Beep (Type 1)

Example: Set the frequency of good decode beep to 3000Hz

1.   Scan the **Enter Setup** barcode.
2.   Scan the **Custom** barcode. (See the **"Beep Frequency"** section in Chapter 6)
3.   Scan the numeric barcodes "3" , "0" , "0" and "0".
4.   Scan the **Save** barcode.
5.   Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

f. Program the LED Notification Duration for Good Decode

Example: Set the LED notification duration to 2000ms

1.   Scan the **Enter Setup** barcode.
2.   Scan the **Custom** barcode. (See the **"LED Notification Duration for Good Decode"** section in Chapter 6)
3.   Scan the numeric barcodes "2", "0", "0" and "0"。
4.   Scan the **Save** barcode.
5.   Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

g. Program the Custom Prefix/Suffix

Example: Set the custom prefix to "CODE"

1. Check the hex values of "CODE" in the ASCII Table. ("CODE": 43, 4F, 44, 45)
2. Scan the **Enter Setup** barcode.
3. Scan the **Set Custom Prefix** barcode. (See the **"Set Custom Prefix"** section in Chapter 7)
4. Scan the numeric barcodes "4", "3", "4", "F", "4", "4", "4" and "5".
5. Scan the **Save** barcode.
6. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

h. Program the Terminating Character Suffix

Example: Set the terminating character suffix to 0x0D

1. Scan the **Enter Setup** barcode.
2. Scan the **Set Terminating Character Suffix** barcode. (See the **"Set Terminating Character Suffix"** section in Chapter 7)
3. Scan the numeric barcodes "0" and "D".
4. Scan the **Save** barcode.
5. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

i. Program the Code ID

Example: Set the Code ID of PDF 417 to "p"

1. Check the hex value of "p" in the ASCII Table. ("p": 70)
2. Scan the **Enter Setup** barcode.
3. Scan the **Modify PDF 417 Code ID** barcode. (See the **"Modify Code ID"** section in Chapter 7)
4. Scan the numeric barcodes "7" and "0".
5. Scan the **Save** barcode.
6. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

j. Program the Length Range (Maximum/Minimum Lengths) for a Symbology

Note: If minimum length is set to be greater than maximum length, the engine only decodes barcodes with either the minimum or maximum length. If you only want to read barcodes with a specific length, set both minimum and maximum lengths to be that desired length.

Example: Set the engine to decode Code 128 barcodes containing between 8 and 12 characters

1. Scan the **Enter Setup** barcode.
2. Scan the **Set the Minimum Length** barcode.   (See the **"Set Length Range for Code 128"** section in Chapter 8)
3. Scan the numeric barcode "8".
4. Scan the **Save** barcode.
5. Scan the **Set the Maximum Length** barcode.   (See the **"Set Length Range for Code 128"** section in Chapter 8)
6. Scan the numeric barcodes "1" and "2".
7. Scan the **Save** barcode.
8. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

k. Program the Discrete Lengths for Interleaved 2 of 5

Example 1: Set the engine to decode Interleaved 2 of 5 barcodes containing either 12 or 24 characters

1. Scan the **Enter Setup** barcode.
2. Scan the **Enable the Discrete Lengths** barcode. (See the **"Set Discrete Lengths for Interleaved 2 of 5"** section in Chapter 8)
3. Scan the **Set the Discrete Length** barcode.
4. Scan the numeric barcodes "0", "1" and "2"."
5. Scan the **Save** barcode.
6. Scan the **Set the Discrete Length** barcode.
7. can the numeric barcodes "0", "2" and "4".
8. Scan the **Save** barcode.
9. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

Example 2: Set the engine to decode Interleaved 2 of 5 barcodes containing between 12 and 24 characters

1. Scan the **Enter Setup** barcode.
2. Scan the **Enable the Discrete Lengths** barcode."
3. Scan the **Set the Discrete Length** barcode.
4. Scan the numeric barcodes "0", "1" and "2".
5. Scan the numeric barcodes "0", "2" and "4".
6. Scan the **Save** barcode.
7. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

Appendix 9: F-Key Barcodes

When the HID-KBW feature is enabled, scanning one of the following barcodes will send the corresponding function key.

F1-F6

⊤	⊣
F1	**F2**

↑	⊢
F3	**F4**

→	←
F5	**F6**

Appendix 11: Save/Cancel Barcodes

After reading numeric barcode(s), you need to scan the **Save** barcode to save the data. If you scan the wrong digit(s), you can either scan the **Cancel** barcode and then start the configuration all over again, or scan the **Delete the Last Digit** barcode and then the correct digit, or scan the **Delete All digits** barcode and then the digits you want.

For instance, after reading the **Maximum Length** barcode and numeric barcodes "1", "2" and "3", you scan:

♢ **Delete the Last Digit:** The last digit "3" will be removed.

♢ **Delete All Digits:** All digits "123" will be removed.

♢ **Cancel:** The maximum length configuration will be cancelled. And the engine is still in the setup mode.

0000160

Save

0000170

Delete the Last Digit

0000180

Delete All Digits
